

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A label application system for transferring labels from a liner onto a target surface using air as a propellant, comprising:
 - (a) a label printer;
 - (b) a label applicator assembly, the applicator assembly having at least an air-directing manifold and an applicator head, the applicator head having a face to receive a label and two angled surfaces, the surfaces joining at an angle from a midpoint of said face of the applicator head;
 - (c) a feed reel for supplying a label provided on a liner to the printer; and
 - (d) a take-up reel for spooling an expended liner, the liner having tension between the feed reel and the take-up reel.
2. (Original) The label application system according to claim 1, further comprising:
a liner take-up motor, wherein the take-up motor is operably coupled to the take-up reel.
3. (Original) The label application system according to claim 2, further comprising:
a clutch, the clutch restricting the take-up reel to turn in only one direction.
4. (Original) The label application system according to claim 2, further comprising:
a liner tension detector.
5. (Original) The label application system according to claim 4, wherein the tension detector is a dancer arm, wherein the position of the dancer arm is detected by a first sensor.

6. (Original) The label application system according to claim 5, wherein the first sensor is an optical sensor.

7. (Original) The label application system according to claim 5, wherein the first sensor is a mechanical sensor.

8. (Original) The label application system according to claim 6, wherein the take-up motor is activated when the tension in the liner drops below a predetermined level.

9. (Canceled)

10. (Previously Presented) The label application system according to claim 1, wherein the printer is a SATO® printer Model No. 8485 SE printer.

11. (Original) The label application system according to claim 1, wherein the feed reel further comprises:

a latch to securely hold the labels onto the feed reel.

12. (Previously Presented) The label application system according to claim 11, wherein the latch has a locked position and an unlocked position.

13. (Original) The label application system according to claim 1, further comprising:
an air supply, wherein the air supply is controlled by a solenoid.

14. (Original) The label application system according to claim 1, further comprising:
a baffle plate, the baffle plate scattering air through the air-directing manifold.

15. (Original) The label application system according to claim 13, further comprising:
a second sensor capable of controlling the air supply.

16. (Canceled)

17. (Currently Amended) A label application method for using air as a propellant to transfer labels from a liner onto a target surface, comprising:

(a) providing a label on a label liner to a printer from a feed reel;

(b) printing a label on a label printer;

(c) positioning a label applicator assembly over a target surface, the applicator assembly having at least an air-directing manifold and an applicator head, the applicator head having a face to receive the label and two angled surfaces, the surfaces joining at an angle from a midpoint of said face of the applicator head;

(d) transferring the label from the liner to the target surface using the applicator head-directed air; and

(e) spooling the expended liner on a take-up reel, the liner having a tension between the feed reel and the take-up reel.

18. (Original) The label application method according to claim 17, further comprising:

detecting the tension between the feed reel and the take-up reel.

19. (Original) The label application method according to claim 17, further comprising:

activating a motor operably coupled to the take-up reel, when the detected tension drops below a predetermined threshold.

20. (Previously Presented) The label application method according to claim 17, wherein the label printer uses at least one of a direct thermal or thermal transfer process.

21. (Canceled)

22. (Original) The label application method according to claim 17, further comprising:

securing the labels to the feed reel with a feed reel latch.

23. (Currently Amended) A label application system using air as a propellant to transfer a label from a label applicator assembly to a target surface, comprising:

(a) a printing means for printing on a label;

(b) an applicator means for applying a label onto a target surface using air as a propellant, the applicator means having at least an air-directing means for directing air to an applicator head means, the applicator head means having a face to receive the label and two angled surfaces, the surfaces joining at an angle from a midpoint of said face of the applicator head;

(c) a label supplying means for supplying labels on a liner to the printer; and

(d) a liner take-up means for spooling the expended liner, the expended liner having tension between the feed reel and the take-up reel.

24. (Original) The label application system according to claim 23, further comprising:

an air supply means for supplying air to the applicator means.

25. (Original) The label application system according to claim 23, further comprising:

a detector means to detect the tension between the feed reel and the take-up reel.

26. (Original) The label application system according to claim 23, further comprising:

a drive means for driving the take-up reel, the drive means being operably coupled to the take-up reel and being activated when the detector means detects a tension drop below a predetermined threshold.

27. (Original) The label application system according to claim 23,

a second sensor capable of controlling the air supply.

28. (Original) The label application system according to claim 23,

wherein the label supplying means is a feed reel, the feed reel having a foot print, and the liner take-up means is a take-up reel, the take-up reel having a foot print, and wherein the feed reel footprint overlaps with the take-up reel footprint.

29. (Original) The label application system according to claim 23,

wherein the label supplying means further comprises a latching means to securely hold the labels onto label supplying means.

30. (Previously Presented) The label application system according to claim 23,

wherein the label printing means is a SATO® Model No. 8485 SE printer.

31. (Previously Presented) The label application system according to claim 23, further comprising:

an air baffling means for scattering air through the applicator head means.

32. (Canceled)

33. (Previously Presented) The labeled application system according to claim 1, wherein the printer is at least one of a direct thermal or thermal transfer printer.

34. (Previously Presented) The label application system according to claim 1, wherein the two surfaces form an angle of about 170 ± 4 degrees.

35. (Previously Presented) The label application system according to claim 23, wherein the two surfaces form an angle of about 170 ± 4 degrees.

36. (Previously Presented) The labeled application system according to claim 23, wherein the printer is at least one of a direct thermal or thermal transfer printer.
